Talking Points – Tobacco 101

Slide 1 – Title

Slide 2 – Number One Killer
Talking Points:

- Tobacco use is the number one cause of preventable death in the United States and worldwide.
  - The top three causes of death in the U.S. are heart disease, cancer, and chronic lower respiratory diseases (CLRD).
  - Smoking and tobacco use is a major risk factor in developing heart disease, cancer (especially lung cancer), and chronic lower respiratory diseases (such as chronic obstructive pulmonary disease, or COPD—an umbrella term that includes diseases such as emphysema and chronic bronchitis).
- Of all of the youth who become new smokers every year, almost a third will ultimately die from a smoking related disease.

Slide 3 – Breakdown of Tobacco Related Deaths
Talking Points:

- More than 480,000 people in the United States will die from cigarette smoking or from exposure to secondhand smoke.
- In the U.S., tobacco kills more people than alcohol, AIDS, car accidents, illegal drugs, murders, and suicides combined.
- In addition, more than 16 million people in the United States suffer from smoking-related diseases and illnesses.
Slide 4 – The Toll of Tobacco in Arizona

Talking Points:

- Point out the statistics regarding smoking and tobacco use in Arizona.
  - Arizona youth have a lower smoking rate than the national average.
- The number of Arizona high school students who smoke is estimated to be 37,200.
  - That’s just a little less than the total number of students enrolled at the University of Arizona (~42,000 students).
  - That’s a lot of high school students in AZ who smoke. Many people are working to increase tobacco prevention efforts in order to reduce this number.

Slides 5 & 6 – Good News and Bad News

Talking Points:

- Emphasize that although cigarette smoking rates in youth have been decreasing over the last several years, the use of e-cigarettes among youth has dramatically increased.
  - The red line on the “Bad News” slide represents the declining cigarette use rate among high school students. The purple line represents the rapidly increasing rate of e-cigarette use among high school students.
- A shocking 24.1 percent of high school students were current users of e-cigarettes (used within the last month) in 2015, the highest rate in any government survey to date.

Slide 7 – First Kids, Now Adults

Talking Points:

- Annual health care costs related to smoking in Arizona: $2.38 billion
- Annual health care costs related to smoking in the United States: over $170 billion
- The above figures do not include costs from smokeless or spit tobacco use.
Slide 8 – Tobacco Marketing
Talking Points:

- Big tobacco companies spend over $9.5 billion **every year** marketing their products in the United States.
  - This adds up to over $25 million **every day**.
- Tobacco companies spend almost $22 million **every year** lobbying members of Congress.
  - The companies want members of Congress to craft laws and regulations favorable to the tobacco industry and to oppose additional regulations on manufacturing and marketing tobacco products.
- Let students know that there is a separate presentation about tobacco marketing targeting youth.

Slide 9 – Types of Tobacco Products (Section Slide)

Slide 10 – Smoked Tobacco
Talking Points:

- Smoked tobacco products need to be lit and inhaled.
- Cigarettes
  - Most common type of smoked tobacco.
  - Consists of finely-cut tobacco leaves rolled in thin paper. Most cigarettes are filtered.
- Hookah
  - A single or multi-stemmed instrument for vaporizing and smoking flavored tobacco, called shisha, whose vapor or smoke is passed through a water basin—often glass-based—before inhalation.
  - Originally from the Middle East.
  - Now popular among young adults in the United States. Hookah lounges are found in many cities and areas with young adults.
- Cigarillos
  - Cigarillos are short, narrow cigars. Like cigars, they are not meant to be inhaled.
They are wrapped in tobacco leaves or brown tobacco-based paper.

Cigarillos can be sold as singles or a two-pack. They are also taxed at a lower rate than cigarettes.

  i. This makes it an appealing, cheaper alternative to cigarettes.

Most significantly, cigarillos can be flavored (unlike cigarettes) and appeal to youth with flavoring such as cherry, grape, peach, and watermelon.

Slide 11 – Smokeless Tobacco
Talking Points:

- Smokeless tobacco includes chew or spit tobacco or dipping tobacco (dip).
- **Dipping tobacco** is a type of finely-ground or shredded, moistened smokeless tobacco product. It often comes in a can, with the most popular brands being Skoal and Copenhagen.
- It is used by placing a lump, pinch, or "dip" of tobacco between the lip and the gum. The act of using it is called dipping.
- Newer products include **dissolvable tobacco**.
  - It consists of finely-processed tobacco which is developed in such a way as to allow the substance to dissolve on the tongue or in the mouth. Varieties include strips, sticks and orbs.
- **Snus** is a moist powder tobacco product usually packaged in a small pouch, thus eliminating the need to spit. It is placed under the upper lip for extended periods.

Slide 12 – E-cigarettes and Hookah Sticks
Talking Points:

- An e-cigarette (e-cig) is a handheld electronic device that vaporizes a flavored liquid, which the user inhales.
- Using e-cigarettes is often called “vaping.”
- The fluid in the e-cigarette is called e-liquid.
- The e-liquid usually contains nicotine and chemical flavorings.
  - There are currently over 8,000 e-liquid flavors including gummy bear, glazed donut, and cookies & cream (aka Oreo).
  - These flavors are often marketed towards youth.
Slide 13 – Harmful Chemicals Found in Cigarettes
Talking Points:
- Over 50 of the chemicals in cigarettes are carcinogens, meaning that they can cause cancer.
- Read through the list of chemicals on the slide and the products the chemicals are used in. Mention to students that if they wouldn't drink or eat the chemicals, why would they smoke them?

Slide 14 – What's in a Cigarette?
Talking Points:
- This is a good visual aid of the names of the chemicals and common household items the chemicals are found in. Again, mention to students that many of these chemicals have been found to cause cancer.

Slide 15 – Nicotine Facts
Talking Points:
- Emphasize that nicotine is a highly addictive chemical. It is found in all tobacco products including e-cigarettes.
- Nicotine increases the amount of dopamine released in the body. Dopamine causes feelings of pleasure and relaxation. However, this feeling is short term and your body craves more nicotine after the pleasurable feelings wear off.
- Scientists have found that nicotine is just as addicting as cocaine and heroin.
- Nicotine withdrawal causes severe side effects, including anxiety, irritability, headache, and hunger. This is why it is so hard for smokers to quit smoking.
